

Ark & ecash:

enemies or friends?

Ark & ecash:

obviously friends !! ♥

Ark

shared UTXOs → VTXOs

atomic exchange of VTXOs

VTXOs are refreshed in rounds

fast direct transfers → “arkoor”

ecash

exchange btc for ecash tokens

custodial mints (multi-sig)

blinded transactions

tokens have superpowers

So how do they
compare?

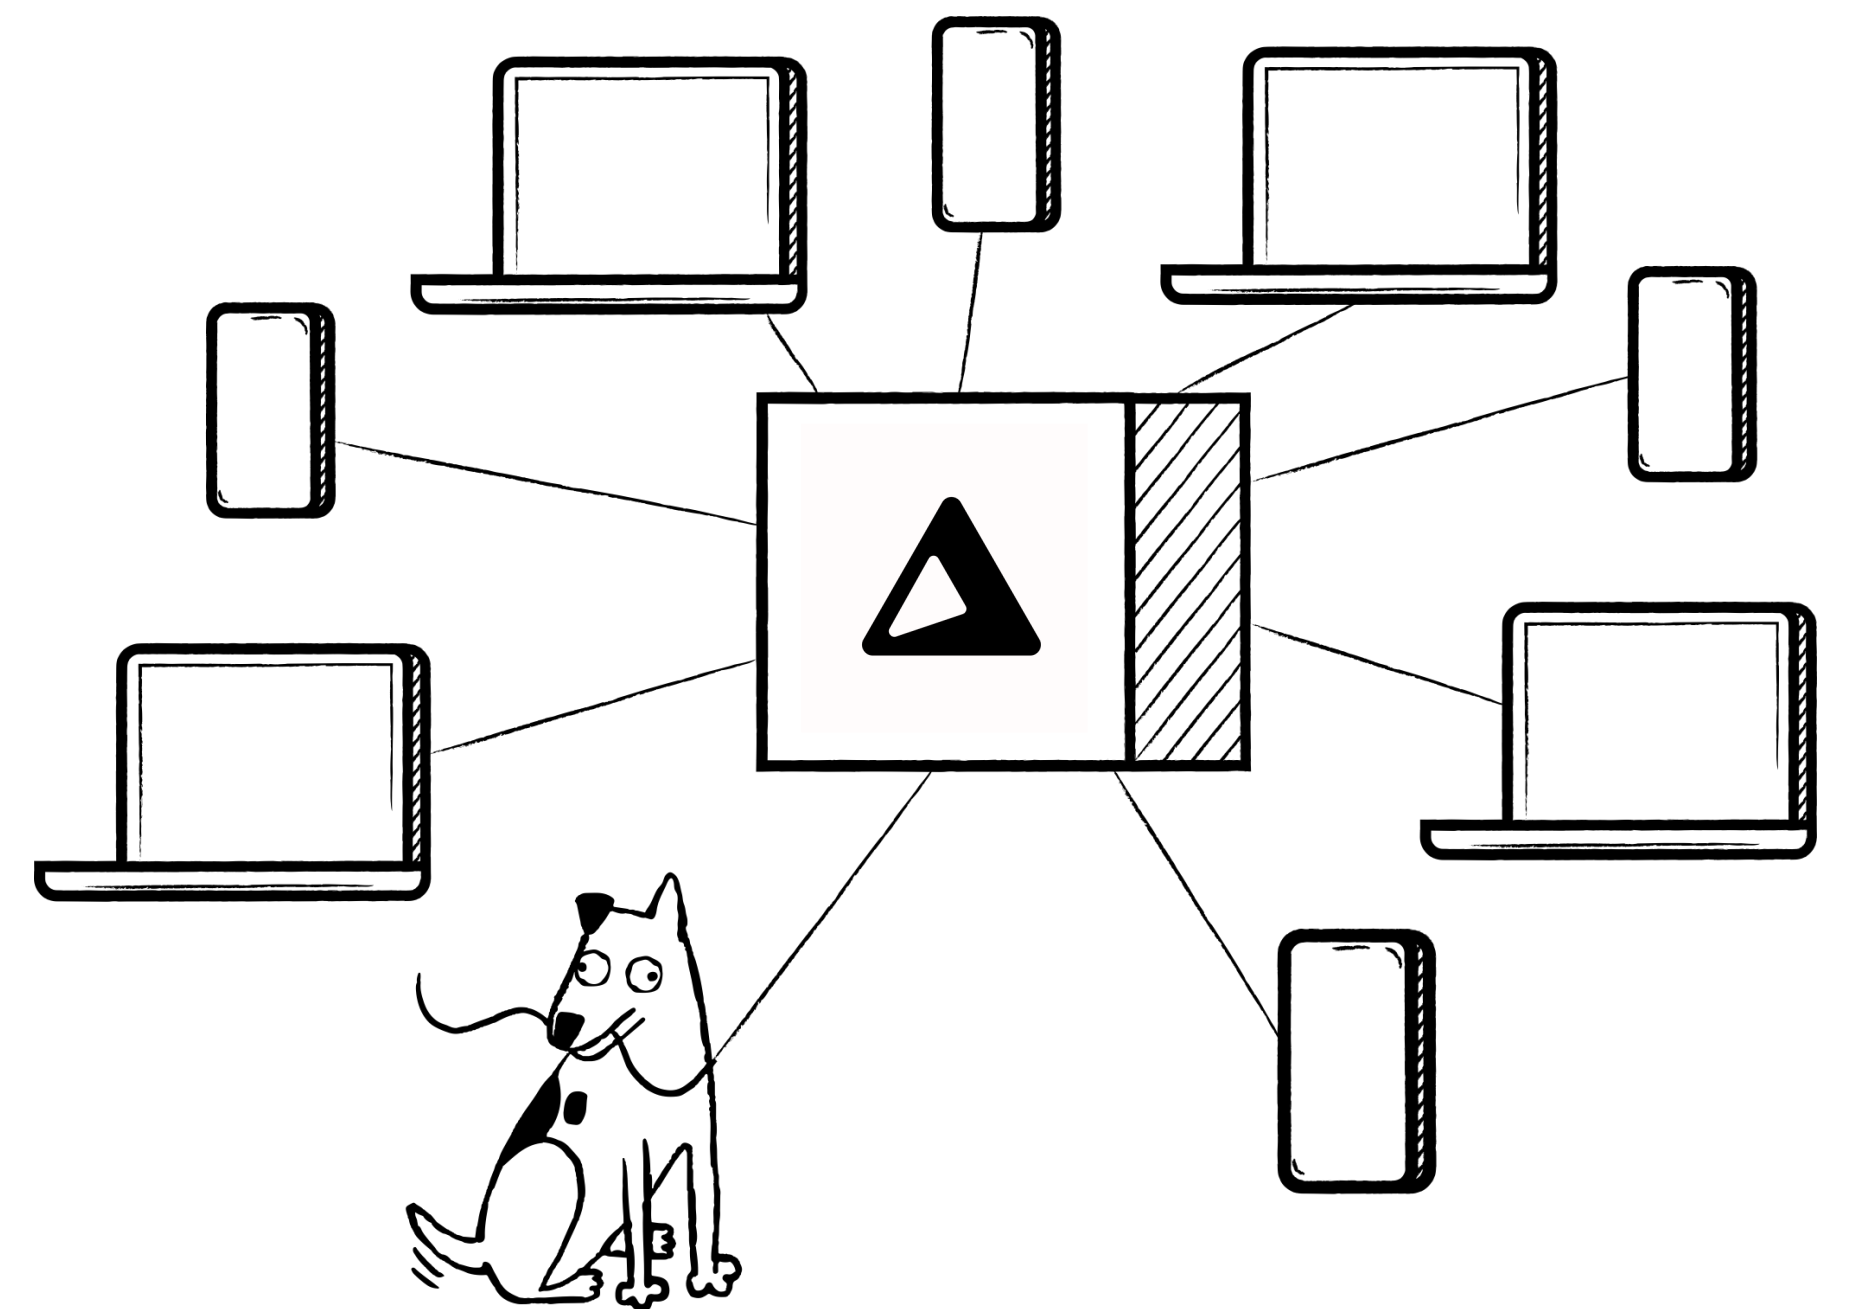

hub-and-spoke

client-server protocols

no p2p required

central coordinator*

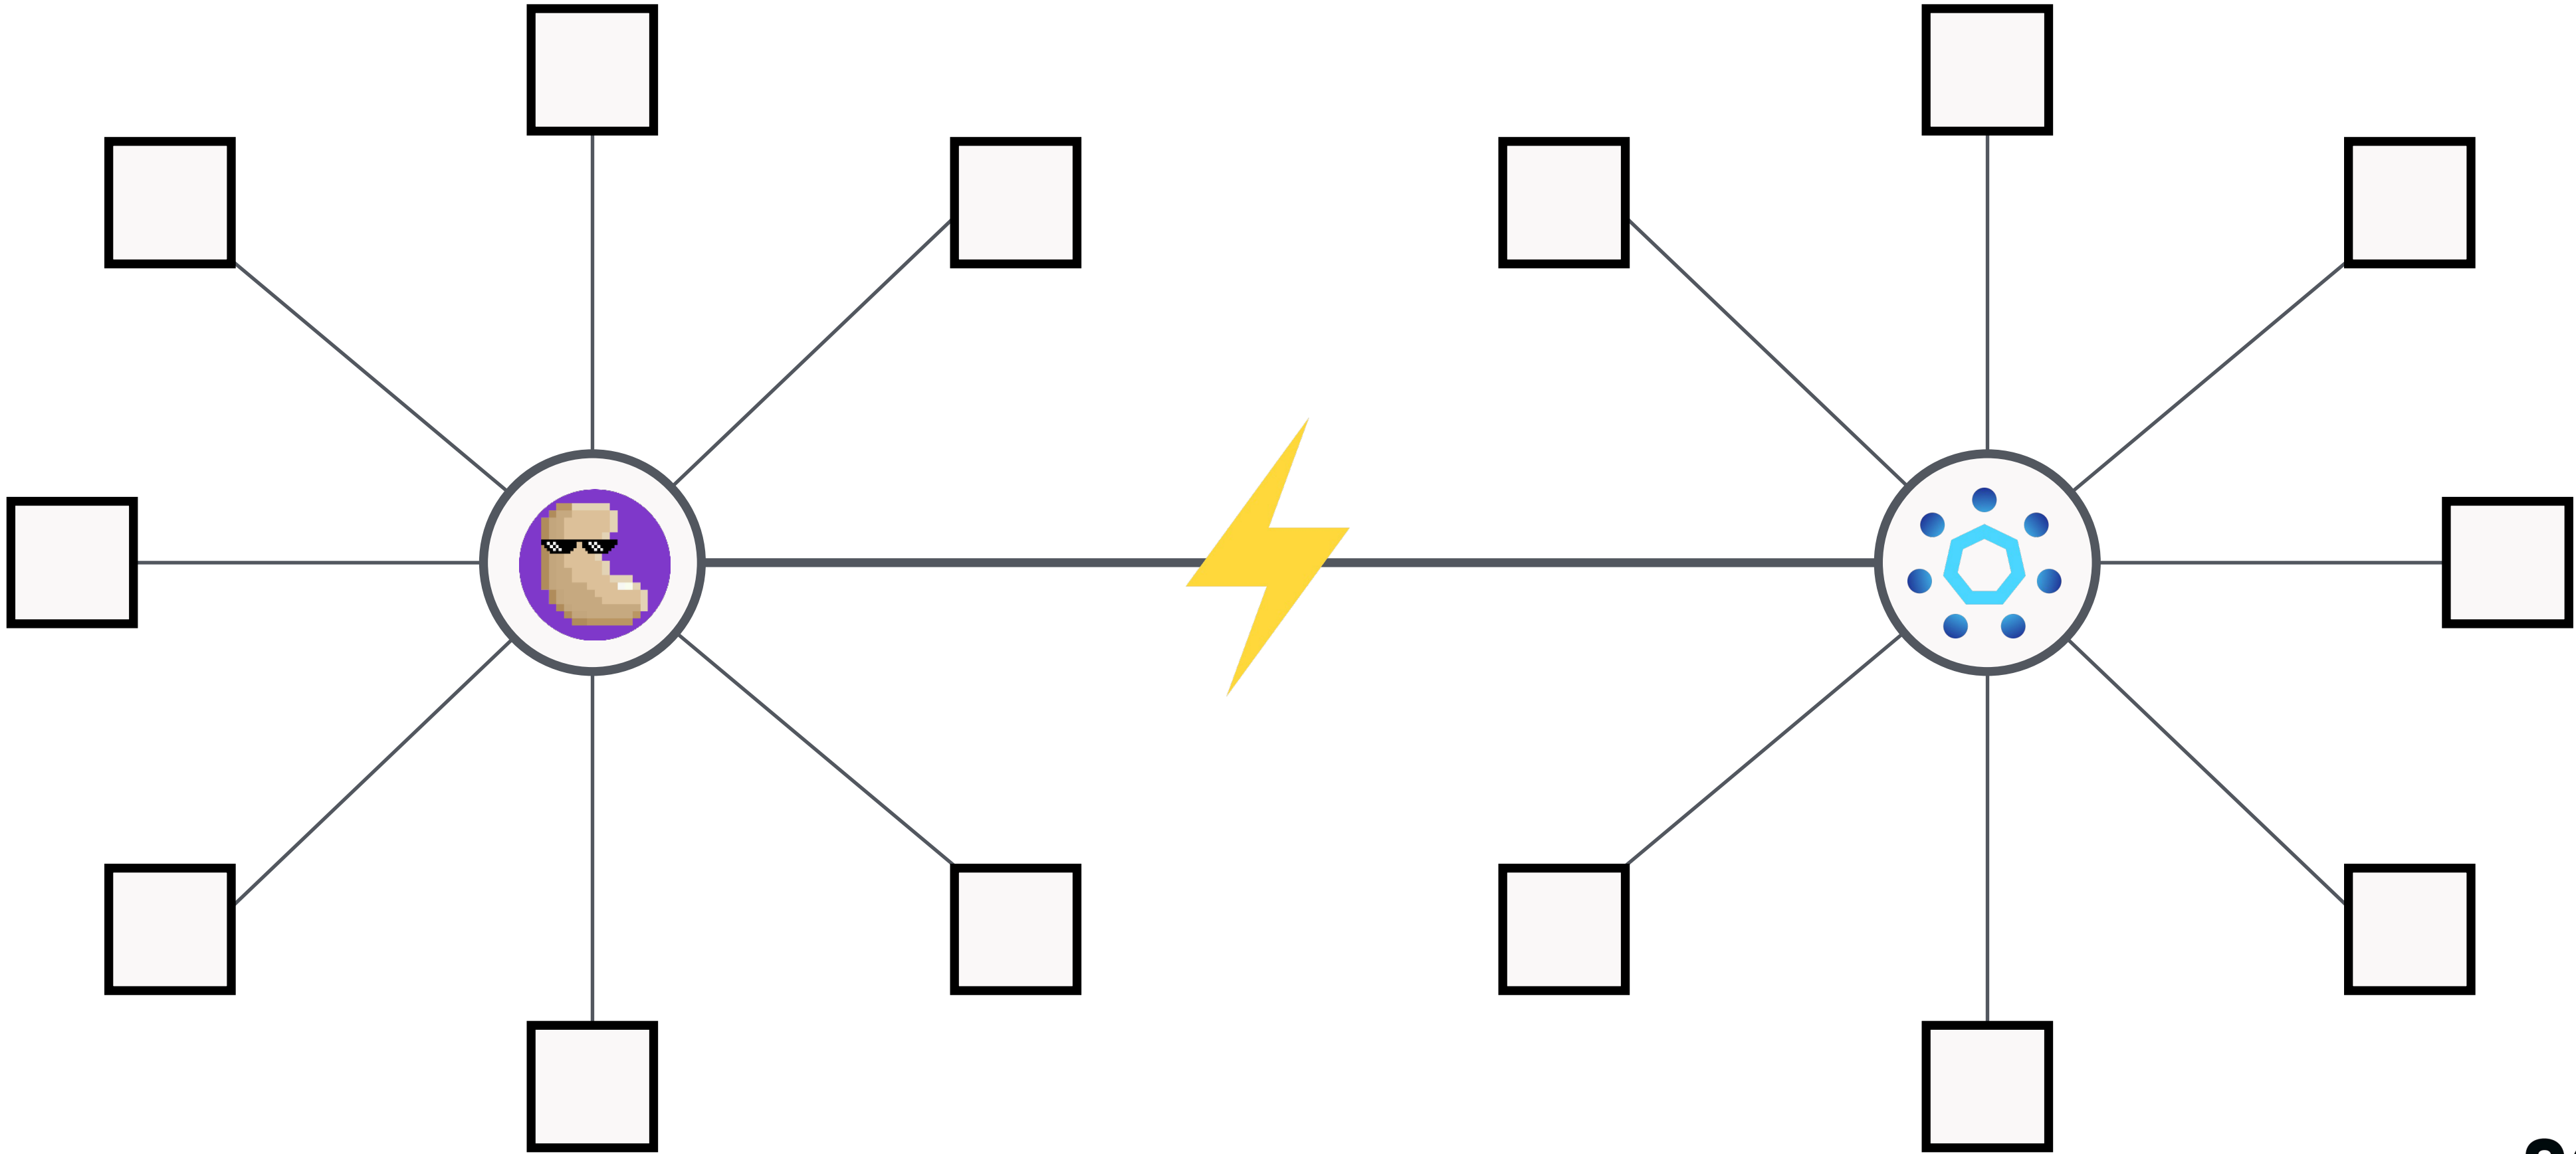

bridging over Lightning

hub-and-spoke

hub-and-spoke

hub-and-spoke

custody

ecash is inherently custodial

mint holds the money

users exchange IOUs

* audits:

proof-of-reserves

proof-of-liabilities

unilateral exit

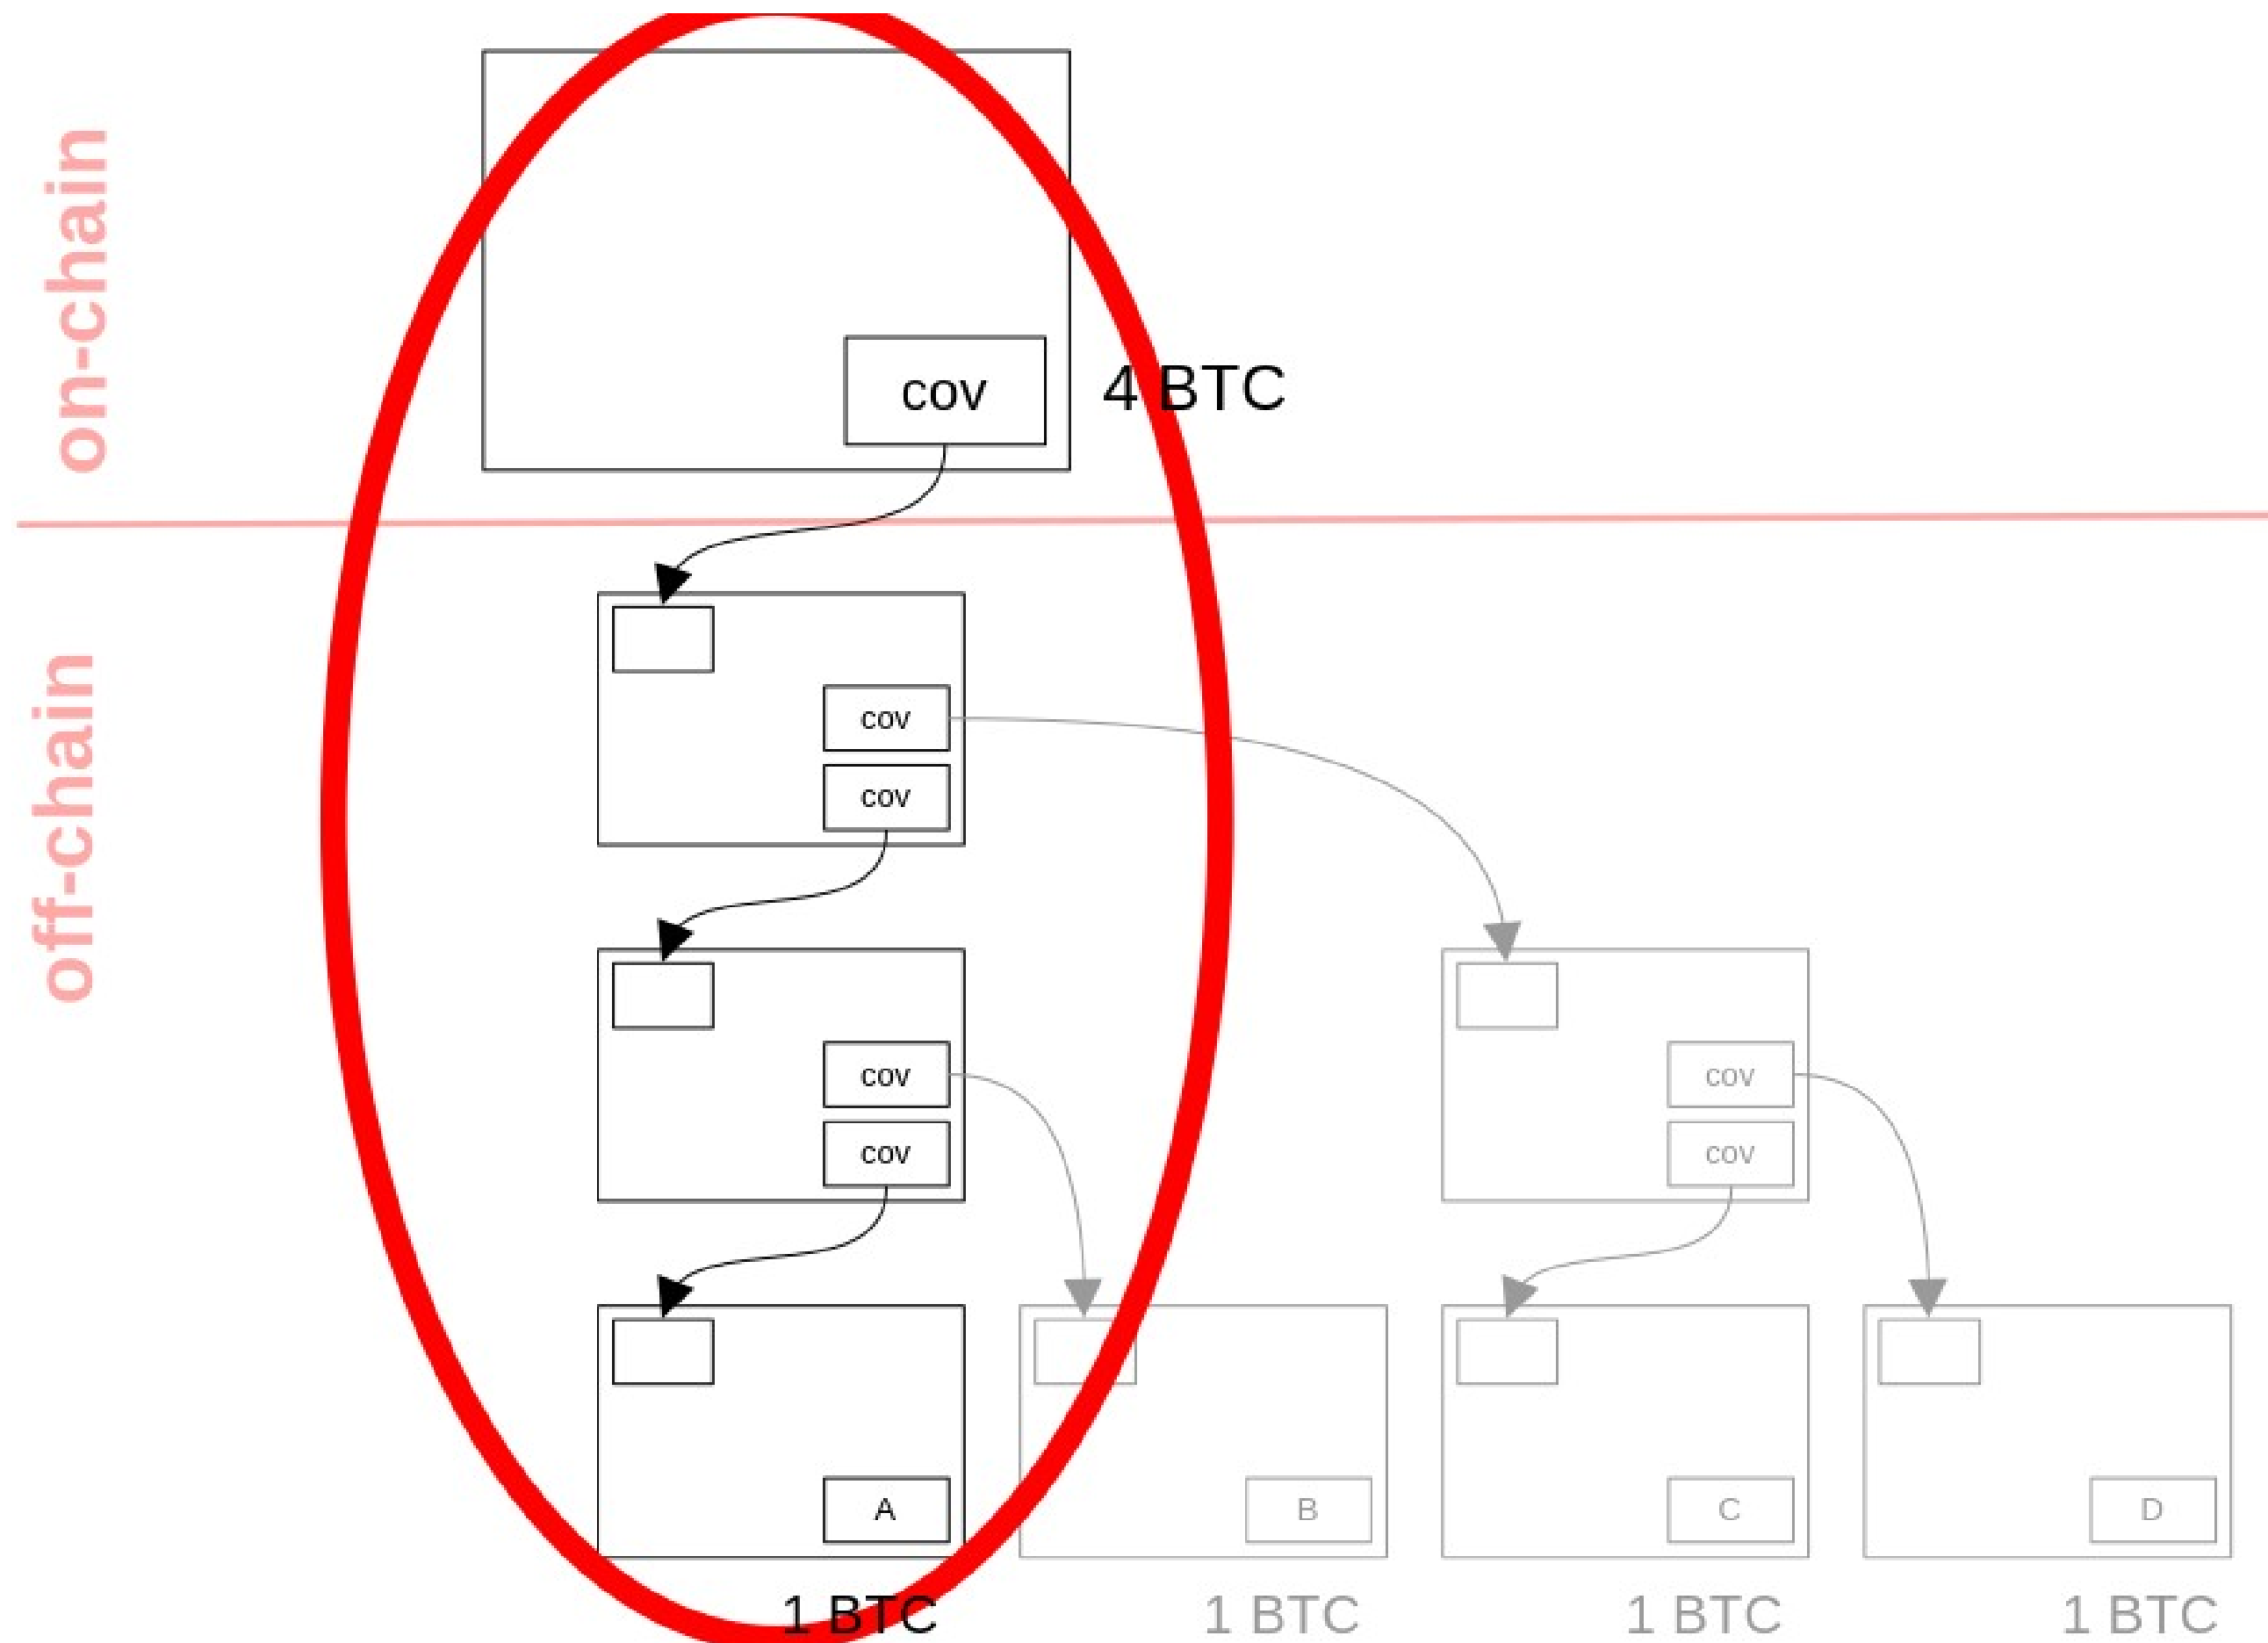

non-custodial

→ true second layer™

can always go on-chain

the exit path **is** the VTXO

limitation on small amounts

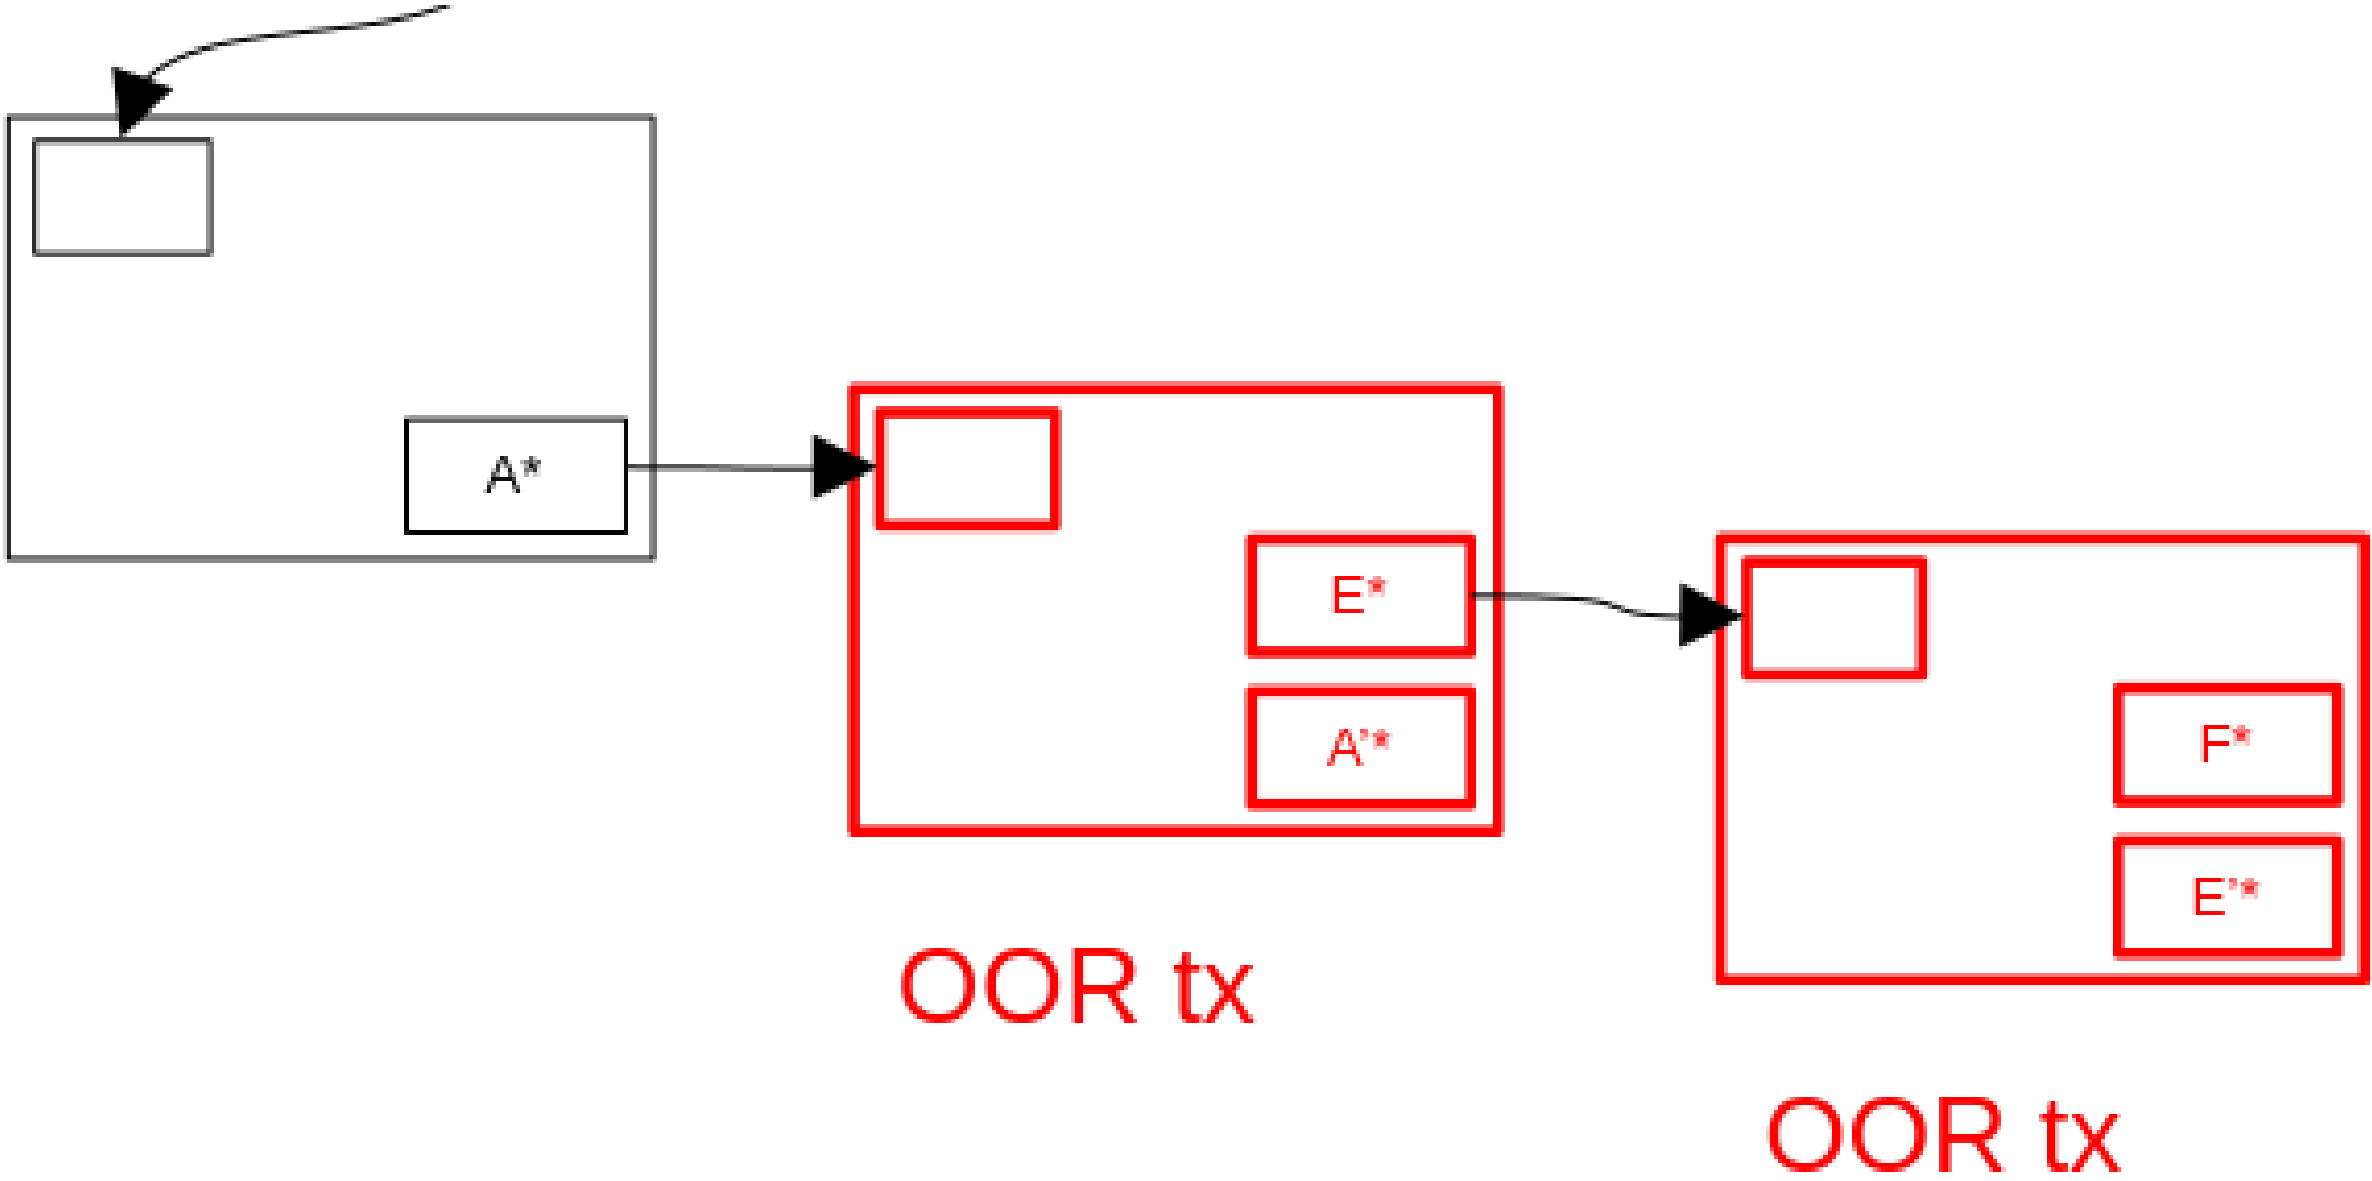

VTXO

second

bitcoin transactions

VTXOs **are** UTXOs (++)

second

bitcoin transactions

VTXOs **are** UTXOs (++)

multiple inputs

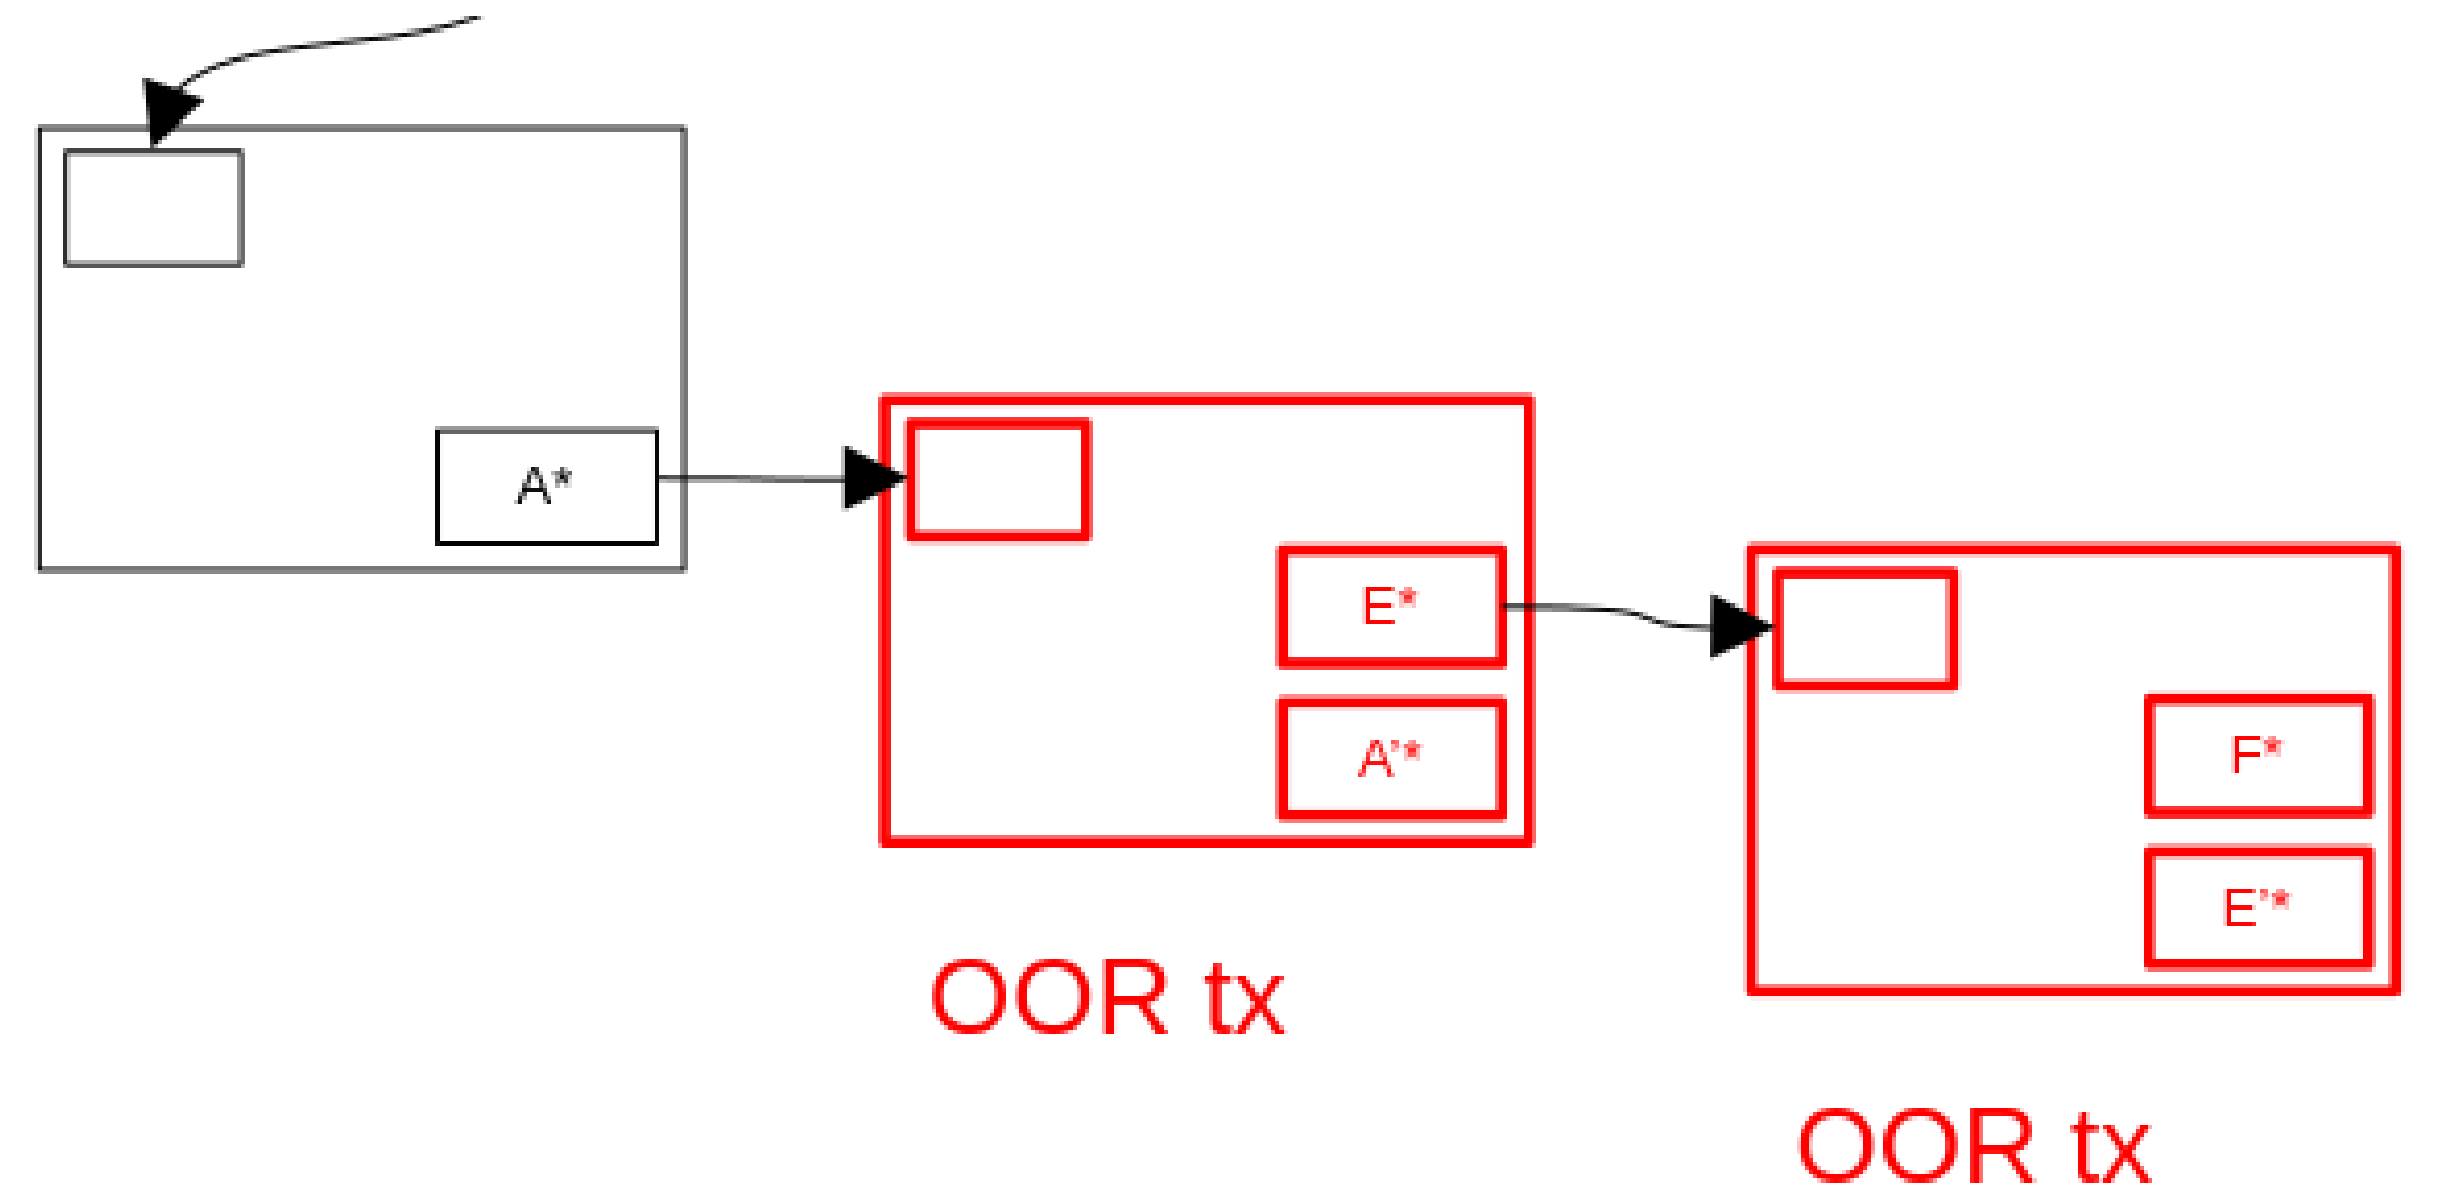

second

bitcoin transactions

VTXOs **are** UTXOs (++)

complex scripts:

- multi-sig
- Lightning channels
- DLCs
- ???

second

privacy

both private from the public

ecash has perfect
privacy from operator

Ark can come very close

blind signatures

the back-bone of ecash

Ark can use blind signatures for rounds
→ similar to WabiSabi

more VTXOs increase exit cost

cost

ecash is virtually free

→ both txs and holding

Ark holding has perpetual cost

→ 30-day expiry → periodic refresh

→ rounds: fixed + fractional

arkoor txs virtually free

→ might want to refresh afterwards

significant costs only at exit time

covenants

ecash doesn't need covenants!

clArk: covenant-less Ark

covenants super-charge Ark
→ OP_CTV / OP_TXHASH

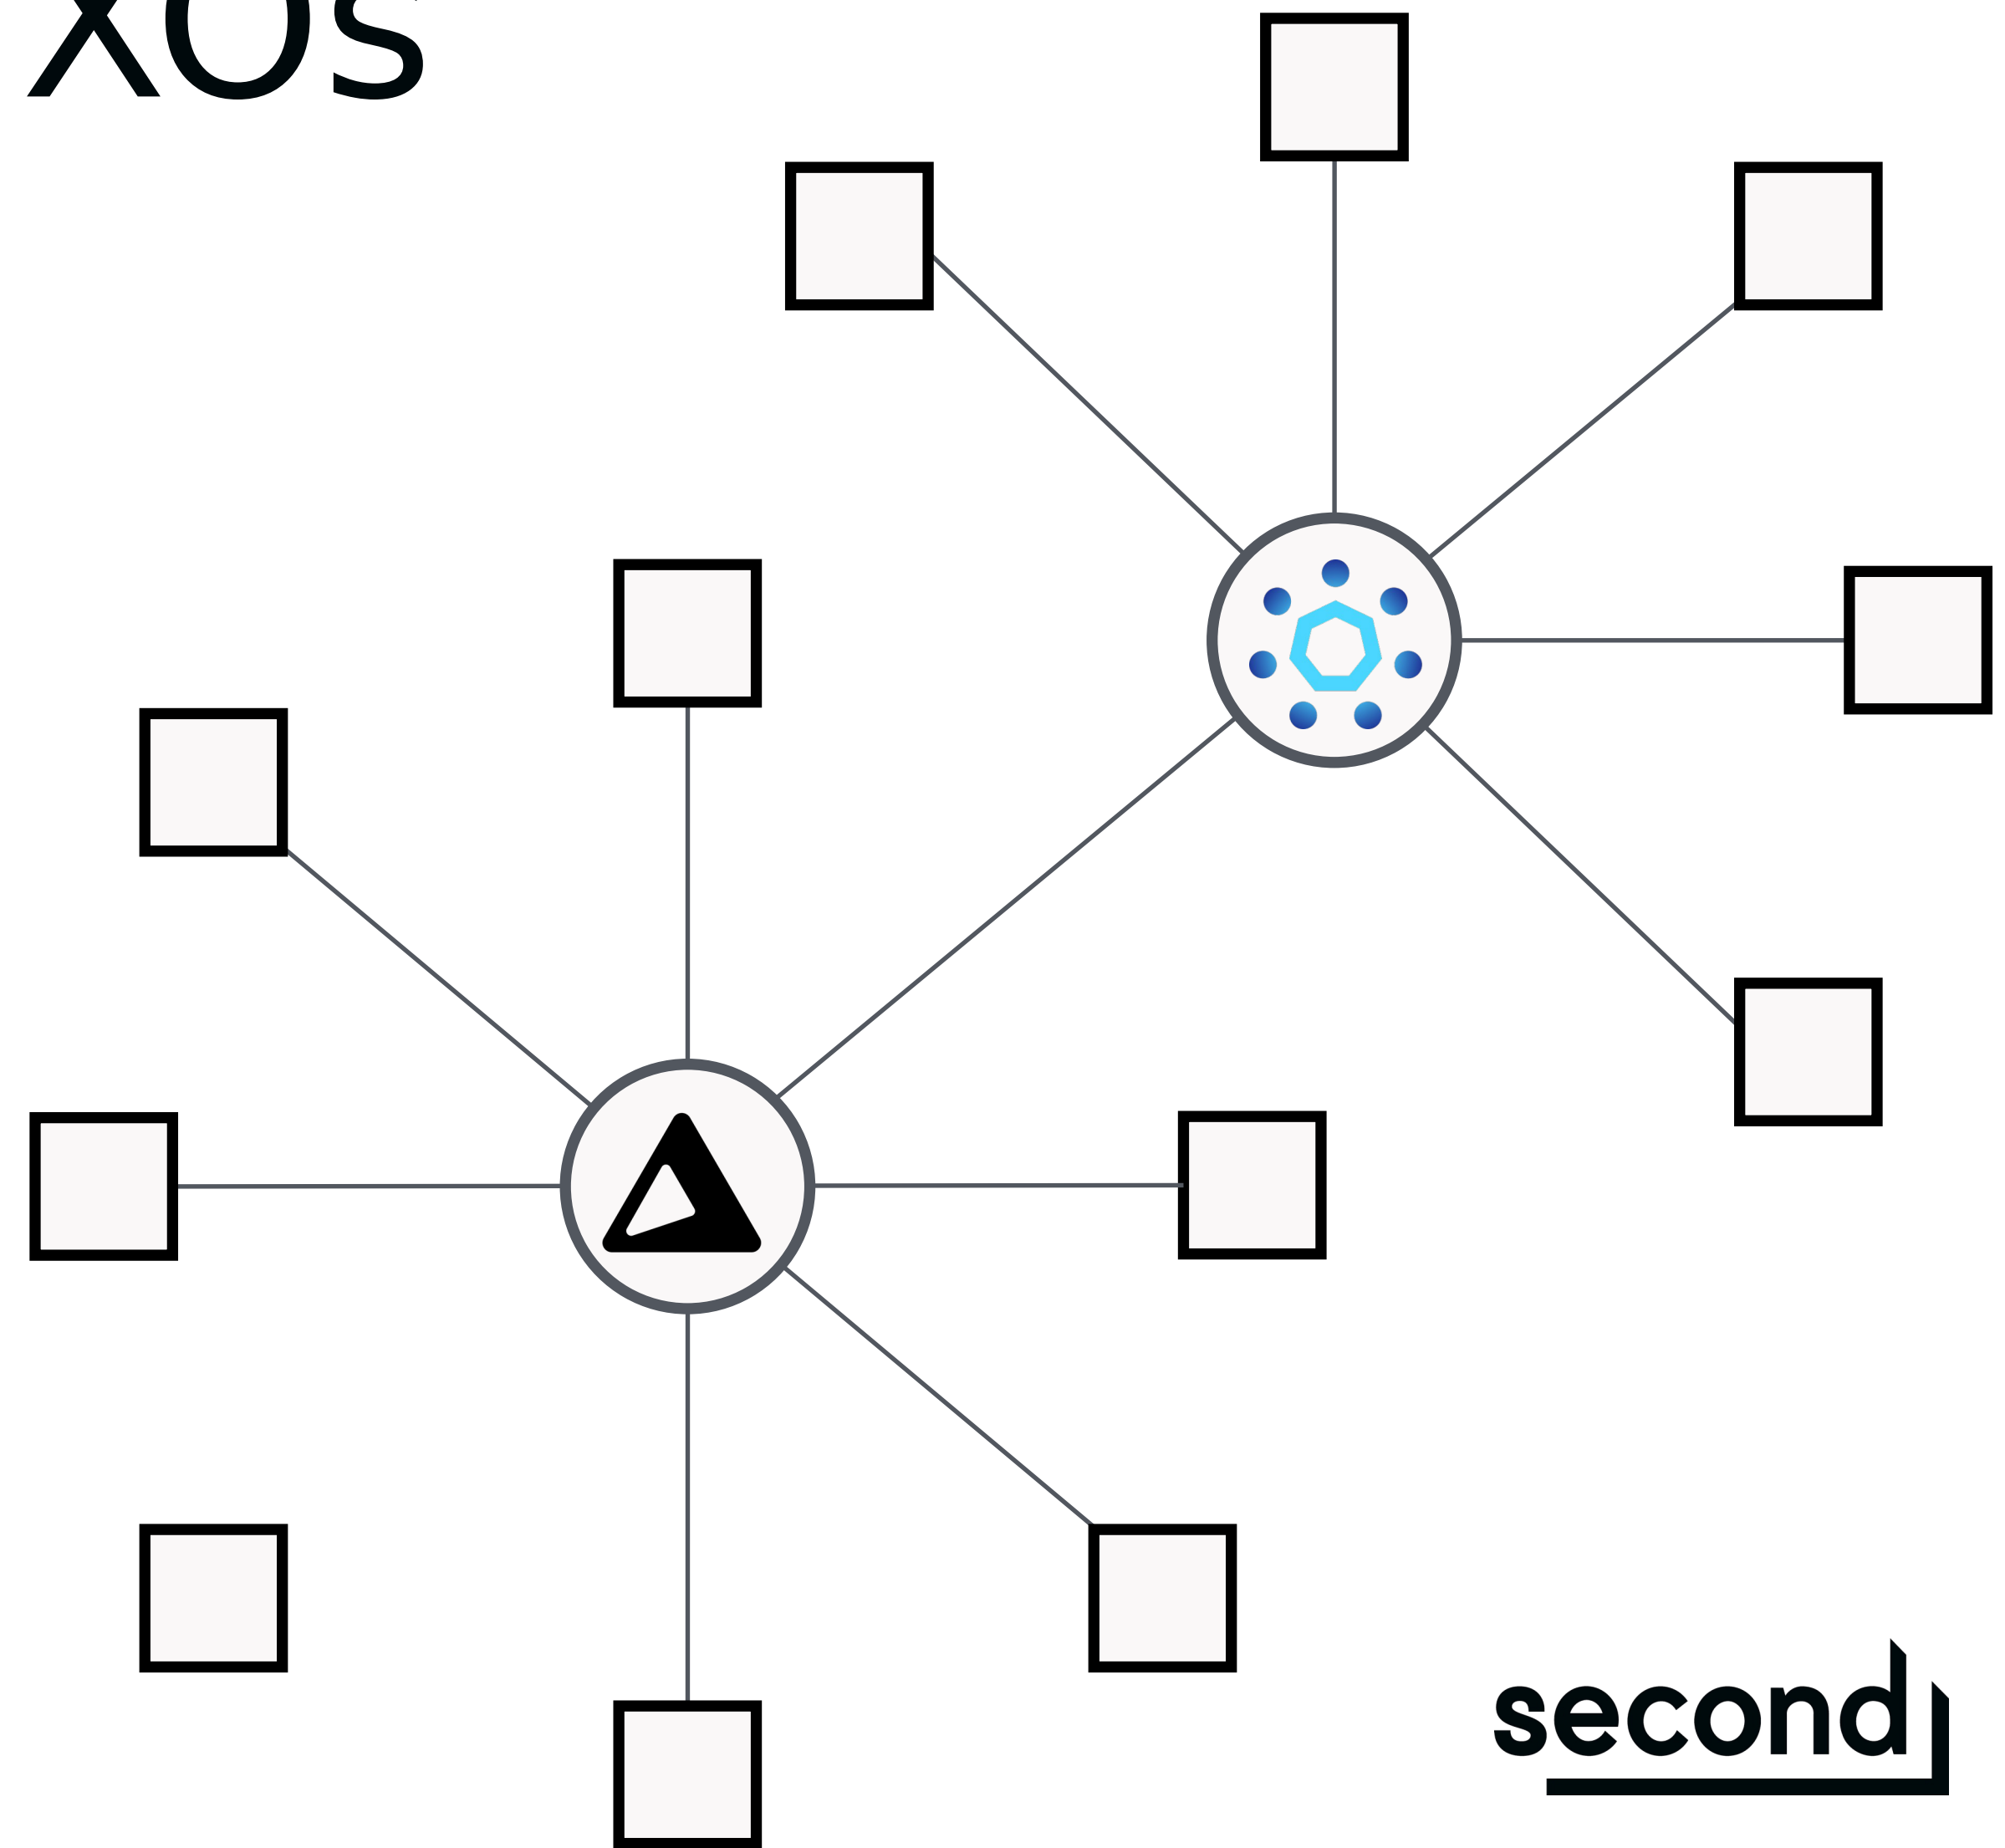

So can we work
together?

mints can own VTXOs

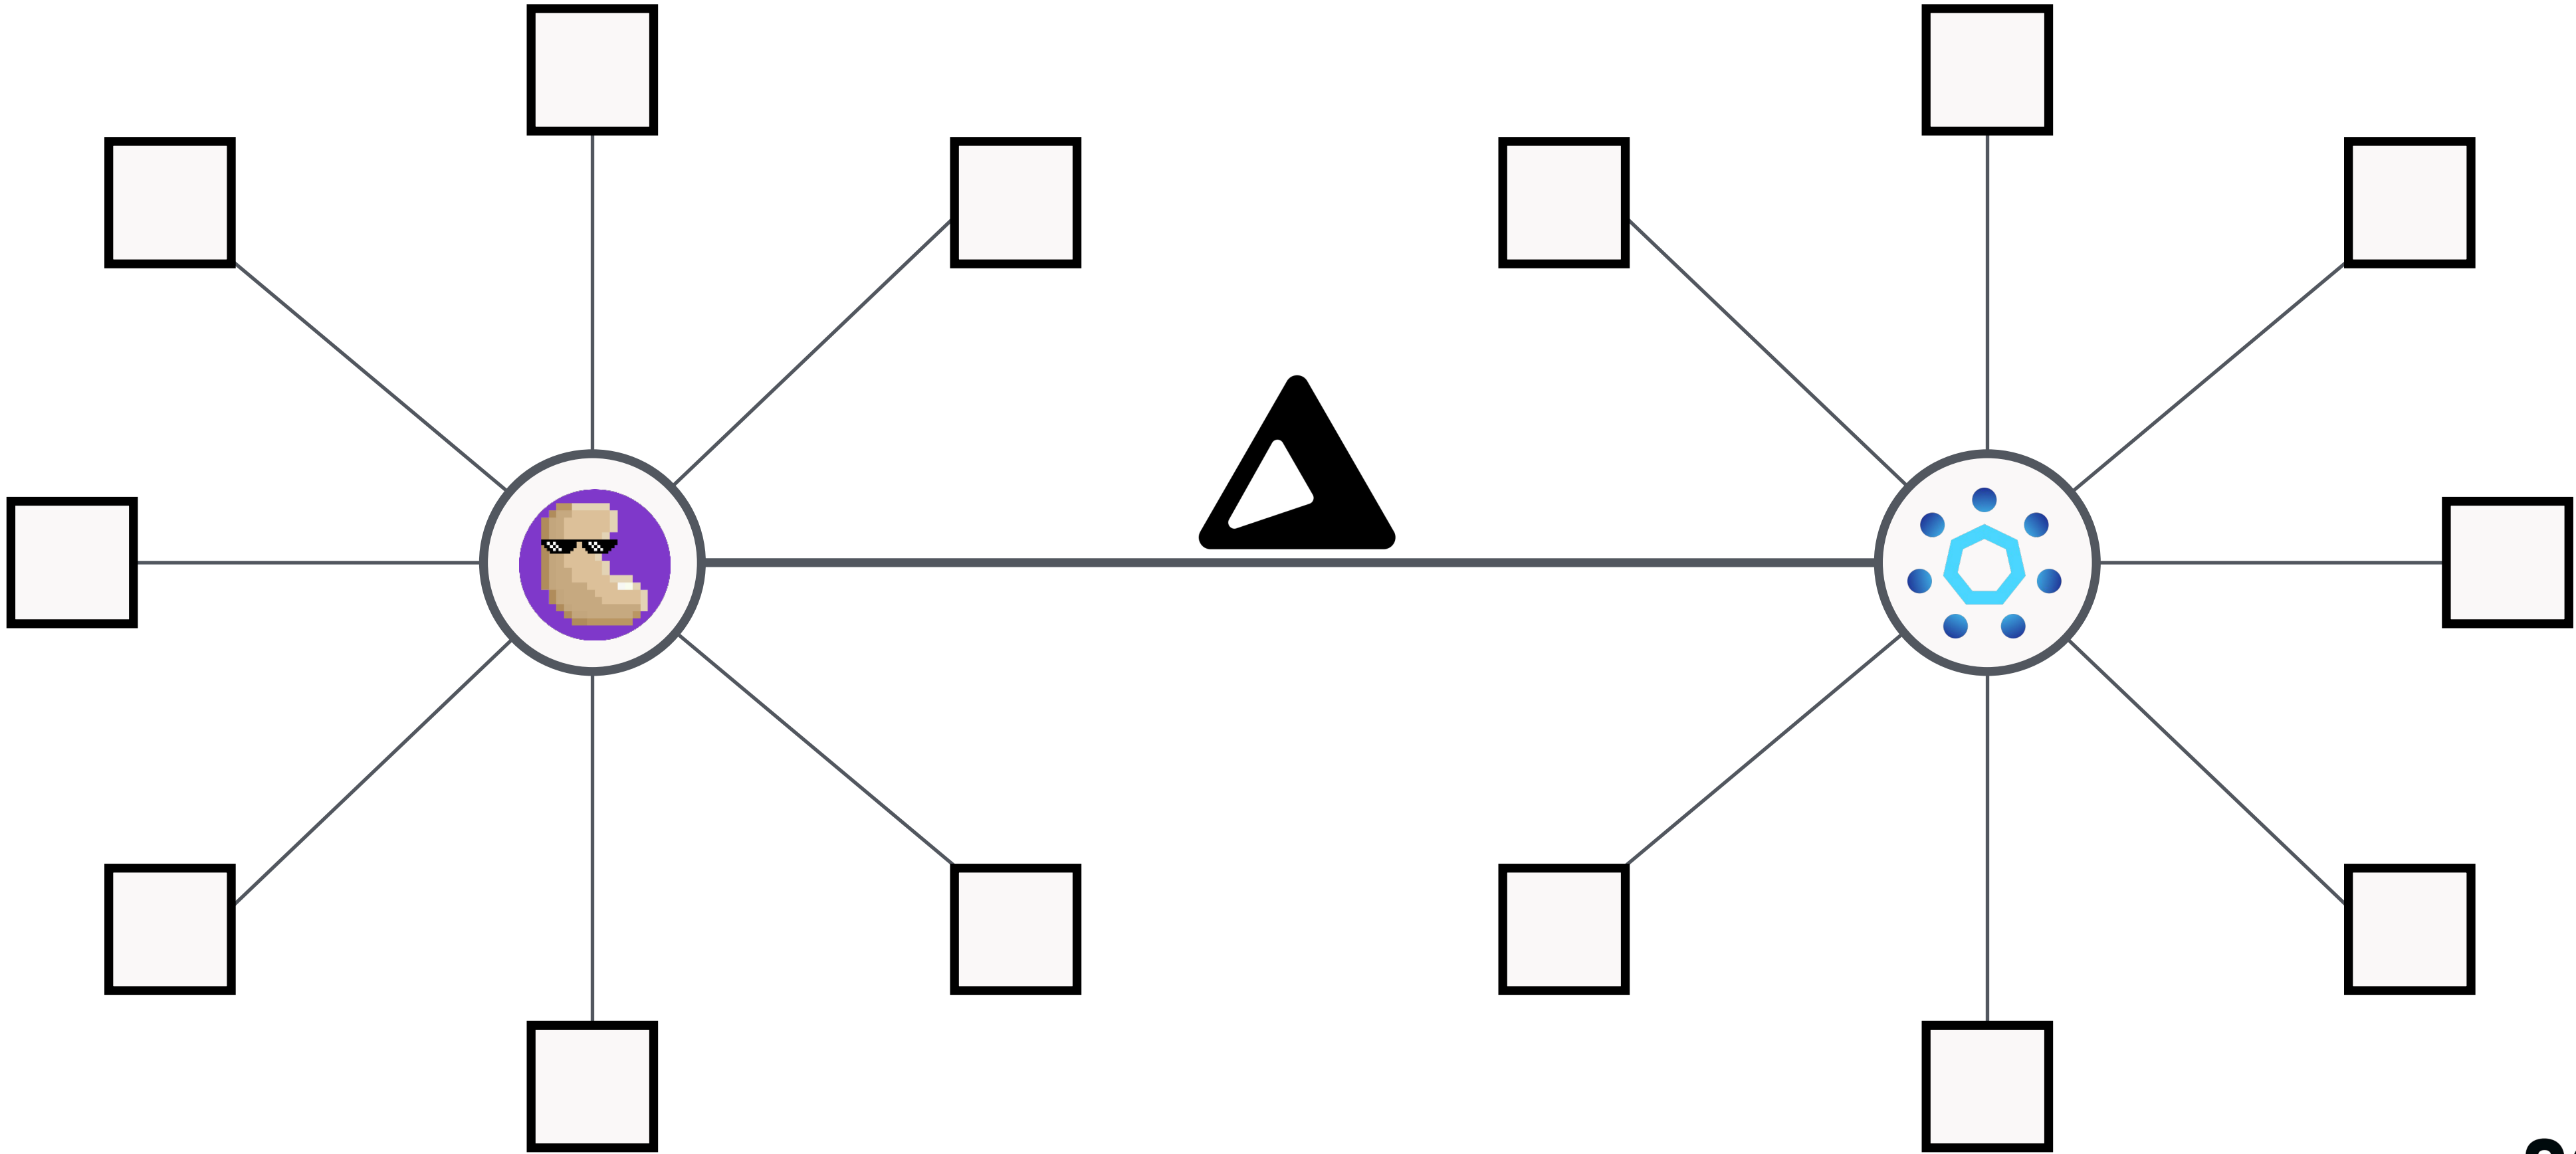

Ark has online requirements
→ mint is always online

cheaper than on-chain

easier than Lightning

inter-mint Ark txs

What's next for Ark?

Second just launched!

bark client in Rust

available for testing

→ codeberg.org/ark-bitcoin/bark
